

Package ‘DeconWK’

July 13, 2010

Type Package

Title Deconvolution by Weighted Kernels

Version 0.4-2

Date 2010-07-13

Author Martin L Hazelton and Berwin A Turlach

Maintainer Berwin A Turlach <berwin@maths.uwa.edu.au>

Description This package contains code for density deconvolution using weighted kernel estimators.

Depends R (>= 2.7.0), kernlab, stats

License GPL (>= 2)

LazyLoad yes

DeconWK-package	<i>Deconvolution by Weighted Kernels</i>
-----------------	--

Description

This package contains code for density deconvolution using weighted kernel estimators. Type ‘citation(“DeconWK”)’ for details of the implemented methods.

Details

The main functions are:

`w.hat:` Calculates the weights for density deconvolution using weighted kernel estimators
`wkde:` Calculates a weighted kernel density estimates
`decon.f:` Calculates a classical deconvolution estimate

Author(s)

Authors: Martin L Hazelton and Berwin A Turlach

Maintainer: Berwin A Turlach <berwin@maths.uwa.edu.au>

References

Hazelton, M.L. and Turlach, B.A. (2009). Nonparametric density deconvolution by weighted kernel estimators, *Statistics and Computing* 19(3): 217–228. <http://dx.doi.org/10.1007/s11222-008-9086-7>.

decon.f

Classical deconvolution density estimate

Description

Calculates the classical deconvolution density estimate given in equation (4) of Hazelton and Turlach (2009).

Usage

```
decon.f(y, eval = NA, h = NA, sigma)
```

Arguments

<code>y</code>	the observed values.
<code>eval</code>	grid on which the deconvolution density estimate be calculated.
<code>h</code>	the smoothing parameter to be used.
<code>sigma</code>	the standard deviation of the contaminating (normal) distribution.

Details

If "`eval`" is not specified, it defaults to `seq(min(y)-sd(y), max(y)+sd(y), length=100)`.

If "`h`" is not specified, the plug-in bandwidth selector developed by Delaigle and Gijbels (2004) is used.

Value

A matrix with two columns named "`x`" and "`y`"; the first column contains the evaluation grid, "`eval`", and the second column the deconvolution density estimate.

Author(s)

Martin L Hazelton <m.hazelton@massey.ac.nz>

References

Delaigle, A. and Gijbels, I. (2004). Practical bandwidth selection in deconvolution kernel density estimation. *Computational Statistics & Data Analysis* 45(2): 249–267.

Hazelton, M.L. and Turlach, B.A. (2009). Nonparametric density deconvolution by weighted kernel estimators, *Statistics and Computing* 19(3): 217–228. <http://dx.doi.org/10.1007/s11222-008-9086-7>.

Examples

```
set.seed(100712)
y <- rden(100, DEN=3, sigma=sqrt(29/40)) # Var(Z)/Var(X) = 0.1
f.hat <- decon.f(y, sigma=sqrt(29/40))
plot(f.hat, type="l")
```

getmin

Approximates the minimum of a function given on a grid

Description

Approximates the minimum of a function given on a grid. Quadratic approximation around the point where the minimal function value is observed is used (if that point is in the interior).

Usage

```
getmin(x, y, which="global", count.minima=FALSE, verbose=TRUE)
```

Arguments

x	Vector with the x-values at which the function is observed. Should be sorted.
y	Vector with the function values.
which	Defines which minimum we want to find. Possible values are "global" for the global minimum, "left" for the left-most local minimum and "right" for the right-most local minimum. Abbreviations ("g", "r", "gl", etc.) may be used.
count.minima	If TRUE, the number of local minima in the observed function values is returned.
verbose	If TRUE, the routine will give a warning if any exceptions occur.

Value

A list with the following elements is returned:

xmin	The x-coordinate of the minimum.
ymin	The approximate value of the function at the minimum.
nmin	The number of local minima in the y-vector (if requested, otherwise 0).
excep	Indicates whether an exception has occurred: -1 if the minimum was found at the left end, 1 if the minimum was found at the right end, 5 if the minimum was in the middle but the quadratic fit yielded a location of the minimum which was outside of the interval defined by the three points used for the quadratic fit and 0 in all other cases.

Note

The vector `x` must be sorted.

Author(s)

Berwin A Turlach <berwin@maths.uwa.edu.au>

Examples

```
x <- -100:100/50
y <- x*x
getmin(x,y)
```

rden

Simulates from specific (contaminated) distributions

Description

Simulates from the distributions considered in Hazelton and Turlach (2009); details of the distributions (all Gaussian mixtures) are given on pages 221–222.

Usage

```
rden(N, DEN = 1, sigma)
```

Arguments

N	number of observations to be simulated; Should be a single number.
DEN	density to simulate from; possible values are 1, 2, 3 and 4 corresponding to the densities described in the paper.
sigma	the standardard deviation of the contaminating measurement error.

Details

The generated random variates are from $X + Z$ where the distribution of X is determined by the argument `DEN` and Z has a normal distribution with mean zero and standard deviation `sigma`; X and Z are independent.

Value

A vector with the generated random variates.

solveqp

Solves a specific quadratic programming problem

Description

Solves the quadratic programming problem (9) of Hazelton and Turlach via a homotopy algorithm approach as described in Appendix B.

Usage

```
solveqp(Qmat, bvec)
```

Arguments

Qmat	The matrix \mathbf{Q} in equation (9a) of Hazelton and Turlach (2009)
bvec	The vector \mathbf{b} in equation (9a) of Hazelton and Turlach (2009)

Value

The vector \mathbf{w} that solves the quadratic problem (9).

Note, the entries in this vector add to one as the code works with a different parameterisation of the weight vector.

w.hat

Calculate weights for deconvolution

Description

Routine to calculate the weights for deconvolution via weighted kernel density estimates.

Usage

```
w.hat(y, sigma, h, gamma,
      METHOD=c("exact", "exact.cv", "svm", "svm.cv"), K=5, verb=FALSE)
```

Arguments

y	the observed, contaminated data.
sigma	the standard deviation of the contaminating (normal) distribution.
h	the bandwidth to be used for the weighted kernel density estimate; if missing the bandwidth returned by <code>bw.SJ(y, method="dpi")</code> will be used.
gamma	the regularisation parameter to be used; either a scalar for methods "exact" and "svm", or a vector of values from which a suitable value is selected via <i>K</i> -fold cross-validation for methods "exact.cv" and "svm.cv".
METHOD	method to be used to solve the quadratic programming problem involved in calculating the weights; if "exact" or "exact.cv" then the solver described in the paper is used, otherwise the routine <code>ipop</code> from the <code>kernlab</code> package.
K	number of folds to be used if gamma is chosen by cross-validation; defaults to 5.
verb	logical; if TRUE some progress report will be printed during cross-validation.

Value

A vector containing the weights; if gamma is chosen by cross-validation, the selected value is returned as an attribute.

Examples

```
set.seed(100712)
sig <- sqrt(29/40) # Var(Z)/Var(X) = 0.1
y <- rden(100, DEN=3, sigma=sig)
gamma <- exp(seq(from=0, to=6, length=17))
w1 <- w.hat(y, sigma=sig, gamma=gamma, METHOD="exact.cv", verb=TRUE)
plot(y, w1, type="h")
attributes(w1)
w2 <- w.hat(y, sigma=sig, gamma=gamma, METHOD="svm.cv", verb=TRUE)
plot(y, w2, type="h")
attributes(w2)

w1 <- w.hat(y, sigma=sig, gamma=gamma, METHOD="exact.cv", K=10, verb=TRUE)
plot(y, w1, type="h")
attributes(w1)
w2 <- w.hat(y, sigma=sig, gamma=gamma, METHOD="svm.cv", K=10, verb=TRUE)
```

```
plot(y, w2, type="h")
attributes(w2)
```

wkde

*Weighted kernel density estimate***Description**

Calculates a weighted kernel density estimate as defined by equation (5) of Hazelton and Turlach (2009).

Usage

```
wkde(y, eval = NA, w = NA, h = NA)
```

Arguments

y	the observed values.
eval	grid on which the deconvolution density estimate be calculated.
w	the weights to be used.
h	the smoothing parameter to be used.

Details

If "eval" is not specified, it defaults to `seq(min(y)-0.1*sd(y), max(y)+0.1*sd(y), length=100)`.

If "w" is not specified, it defaults to a vector of ones.

If "h" is not specified, it defaults to `bw.SJ(y, method="dpi")`.

Value

A matrix with two columns named "x" and "y"; the first column contains the evaluation grid, "eval", and the second column the deconvolution density estimate.
